

imbalance, equivalent to the quantity of energy of exploding more than 400,000 atomic bombs of the kind dropped on Hiroshima, Japan, per day, 365 days per year, across the planet;

Whereas the latest climate science and real-world observations of that energy imbalance demonstrate that the approximately 1 degree Celsius of warming that has already occurred as a result of human-caused climate change is already dangerous and negatively affecting all aspects of society and the economy of the United States;

Whereas the last time that atmospheric concentrations of carbon dioxide were over 400 parts per million—

- (1) the seas were 70 to 90 feet higher;
- (2) Greenland had no ice; and
- (3) coral reefs suffered a major extinction;

Whereas similar conditions will result if the United States does not drastically reduce carbon dioxide emissions and naturally sequester excess concentrations of atmospheric carbon dioxide during the 21st century;

Whereas climate change is a threat to national security, as climate change contributes to and exacerbates global instability and conflict;

Whereas the generation of today's children was born into a climate system made hazardous to their health and well-being because of human-caused climate change;

Whereas children are uniquely vulnerable to human-caused climate change because of their developing bodies, higher exposure to air, food, and water per unit of body weight, unique behavior patterns, dependence on caregivers, and longevity on the planet;

Whereas human-caused climate change is a public health emergency that is adversely impacting the physical and mental health of children through—

- (1) extreme weather events;
- (2) rising temperatures and increased heat exposure;
- (3) decreased air quality;
- (4) altered infectious disease patterns;
- (5) food and water insecurity; and
- (6) other effects;

Whereas the best scientific information available projects a 15- to 30-foot rise in sea level by the year 2100 if current trends continue, with ever greater rises and acceleration in subsequent centuries, resulting in increased erosion and the loss of land, causing the loss of communities, homes, infrastructure, agriculture, and coastal ecosystems for children affected, until such time as levels of carbon dioxide in the atmosphere are dramatically reduced and steps are taken to cool the upper portion of the ocean;

Whereas infant mortality increases 25 percent on extremely hot days, with the first 7 days of life representing a period of critical vulnerability;

Whereas heat illness is a leading cause of death and illness in high school athletes, with nearly 10,000 episodes of heat illness occurring annually;

Whereas 8.4 percent of children suffer from allergic rhinitis, and the ragweed pollen season in North America has grown 13 to 27 days longer since 1995 due to higher temperatures and greater atmospheric carbon dioxide levels;

Whereas children are especially susceptible to air pollution given their developing lungs, higher ventilation rate, and higher levels of physical activity;

Whereas children exposed to smoke from wildfires, which have increased in frequency and severity due to rising temperatures and droughts, suffer substantial—

- (1) eye symptoms; and
- (2) upper and lower respiratory symptoms that lead to increased rates of asthma-related hospitalizations and emergency room visits;

Whereas long-term exposure to fine particulate matter, including from sources of air pollution and smoke from wildfires, is associated with higher COVID-19 mortality rates;

Whereas extreme weather events can negatively impact the mental health of children due to—

- (1) family loss or separation;
- (2) school interruption;
- (3) scarcities of food, water, and shelter; and
- (4) public service outages;

Whereas, without immediate steps to address human-caused climate change, the health effects of climate change on children will—

- (1) increase in severity and in terms of the number of children impacted; and
- (2) cost the United States billions of dollars per year by the end of the 21st century;

Whereas children will largely shoulder the costs of human-caused climate change;

Whereas further increases in global temperature will saddle children with an enormous, perhaps incalculable, cost burden, undermining their economic security and the economic security of the United States;

Whereas children are deserving of special consideration and protection with respect to human-caused climate change;

Whereas children on the frontlines of human-caused climate change across the United States and globally have risen up and called upon government leaders around the world to take concrete, science-based, and equitable action—

- (1) to address human-caused climate change; and
- (2) to ensure environmental and climate justice for their generation and future generations, including children from vulnerable communities that have borne the brunt of climate change;

Whereas children within environmental justice communities, including communities of color, low-income communities, and indigenous communities, that have contributed the least to emissions—

- (1) have long suffered from systemic environmental racism and social and economic injustices;
- (2) are disproportionately burdened by adverse health or environmental effects; and
- (3) are subjected to disproportionate energy burdens;

Whereas members and children from frontline and environmental justice communities, who are more likely to reside in areas with greater exposure to air pollution, are disproportionately impacted by the COVID-19 pandemic;

Whereas global atmospheric carbon dioxide concentrations must be reduced to less than 350 parts per million by the end of the 21st century, with further reductions thereafter, to restore the energy balance of the planet, stabilize the climate system, and protect the ice sheets and oceans for posterity;

Whereas existing and future adverse public health and other impacts and costs to children and the United States can be significantly mitigated if the United States acts promptly to reduce emissions from fossil fuels in the United States;

Whereas numerous experts have concluded that there are multiple technically and economically feasible pathways to place all sectors of the economy of the United States on an emissions-reduction path consistent with returning global atmospheric carbon dioxide to 350 parts per million by 2100;

Whereas producing energy in the United States with non-carbon emitting sources will result in energy costs within the range of recent experience, ultimately saving consumers money and stabilizing the cost of energy, while increasing the number of jobs in the energy sector; and

Whereas multiple Federal departments and agencies can exercise authority delegated by Congress to prevent and respond to climate change, including—

- (1) the Department of Energy;
- (2) the Department of the Interior;
- (3) the Department of Agriculture;
- (4) the Environmental Protection Agency;
- (5) the Department of Commerce; and
- (6) the Department of State: Now, therefore, be it

Resolved by the Senate (the House of Representatives concurring), That it is the sense of Congress that—

- (1) renewed leadership by the United States is needed immediately to address the human-caused climate crisis that is disproportionately affecting the health, economic opportunity, and fundamental rights of the children of the United States; and
- (2) there is an urgent human-caused climate crisis that—

(A) has inspired children across the United States to organize and demand immediate government action to protect their fundamental rights from the perils of climate change; and

(B) demands a national, comprehensive, science-based, and just climate recovery plan that—

(i) is prepared by Federal departments and agencies pursuant to delegated authority over energy and climate policy; and

(ii) upholds the fundamental rights of children and puts the United States on a trajectory consistent with reducing global atmospheric carbon dioxide to less than 350 parts per million by 2100.
